**What was one specific bug you encountered?**

The main bug that occurred was with creating all methods themselves. Especially, with Math.max and Math.min fucntions. At first, I accidentally mixed the way they work, which led to the code working incorrectly. But eventually I figured out the way how these Math functions work and was able to fix all bugs.

**What design decision did you make for your "Unique Attribute"?**

I have added commentaries for each interaction with a pet and also created my own bath method. This made the game more fun since it is now possible to lose happiness, influencing decisions of user. As for designed, I just added spaces between each method for better readability and added comments.

**How would you improve this pet if you had more time?**

I would have probably added more properties and interactions with the pet. And add more unique situations with commentaries.
